This is particularly significant for studying macromolecular complexes and cellular structures, revealing details of protein function and assembly that are impossible to obtain with traditional electron microscopy methods. Cryo-EM has revolutionized structural biology, playing a crucial role in determining the structures of numerous proteins and viruses.
- **Scanning Transmission Electron Microscopy (STEM):** STEM uses a finely focused electron beam to scan across a sample, collecting scattered electrons to form an image. This technique allows for high-resolution imaging of both the surface and interior of a sample, offering complementary information to TEM. STEM-based techniques like **electron energy loss spectroscopy (EELS)** and **energy-dispersive X-ray spectroscopy (EDS)** provide chemical information about the sample at the nanoscale.
